

TB DRUG DISCOVERY BIOASSAY RESOURCES

Scott Franzblau

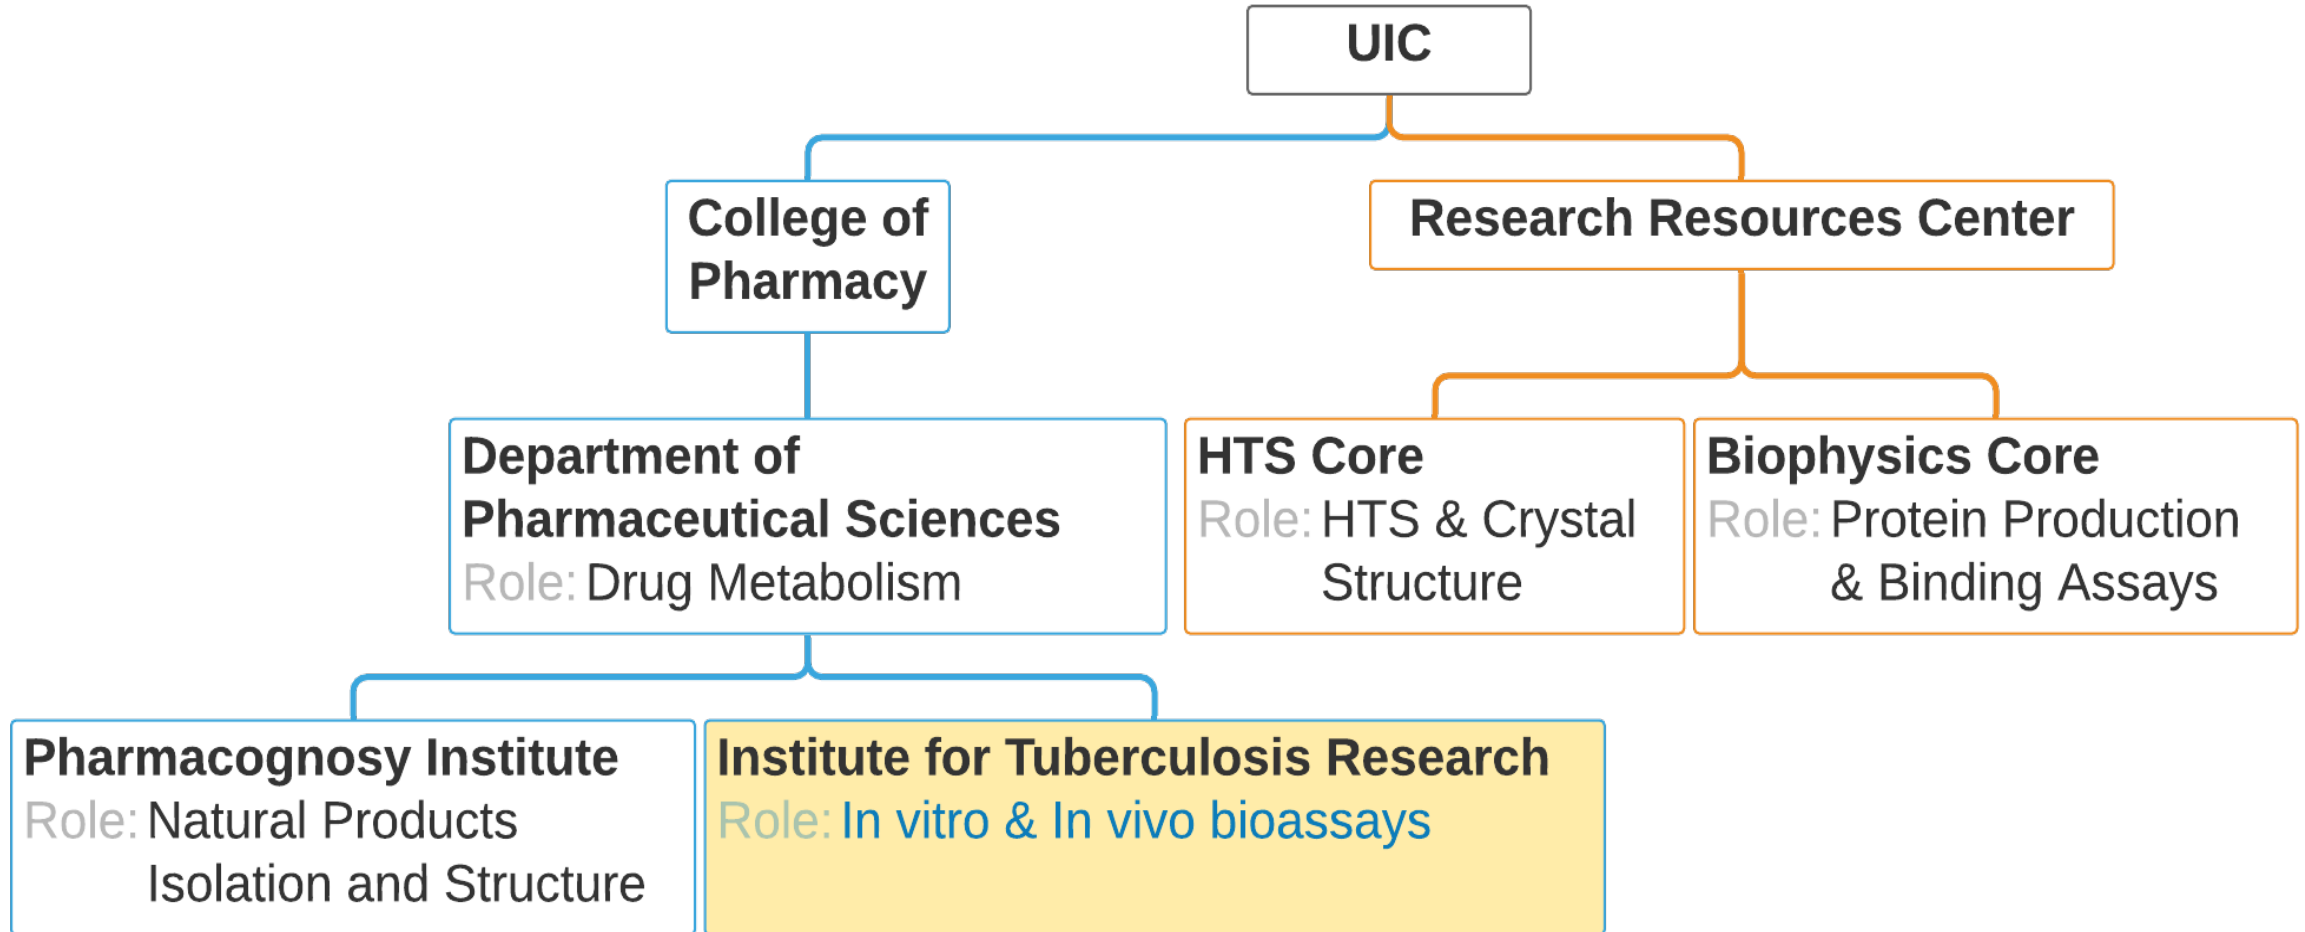

Director, Institute for Tuberculosis Research

Professor, Department of Pharmaceutical Sciences

Institute for Tuberculosis Research | University of Illinois at Chicago

Multiple UIC units support TB drug discovery

Challenges and Solutions in Early-Stage TB Drug Discovery

Challenge	Solution
Virulence of <i>M. tuberculosis</i> (<i>Mtb</i>) + lack of avirulent surrogate species with similar drug susceptibility	Use virulent but drug-sensitive <i>Mtb</i> Powered Air Purifying Respirators (PAPR) Biosafety Level 3 lab
Slow growth of <i>Mtb</i> , 3 weeks for colony formation	Metabolic surrogates of viability: <ul style="list-style-type: none">• Resazurin reduction (Microplate Alamar Blue Assay; MABA)• Luciferase reporter genes• Intracellular ATP
Early ID of treatment shortening potential	Determine killing of non-growing culture by Low Oxygen Recovery Assay (LORA)
Mouse models take 1.5 – 2.5 months	qPCR reduces time by 3 weeks

1st & 2nd Generation Bacterial Luciferase Reporters

First Generation

Plasmid-borne

Requires substrate (n-decanal)

End-point assay

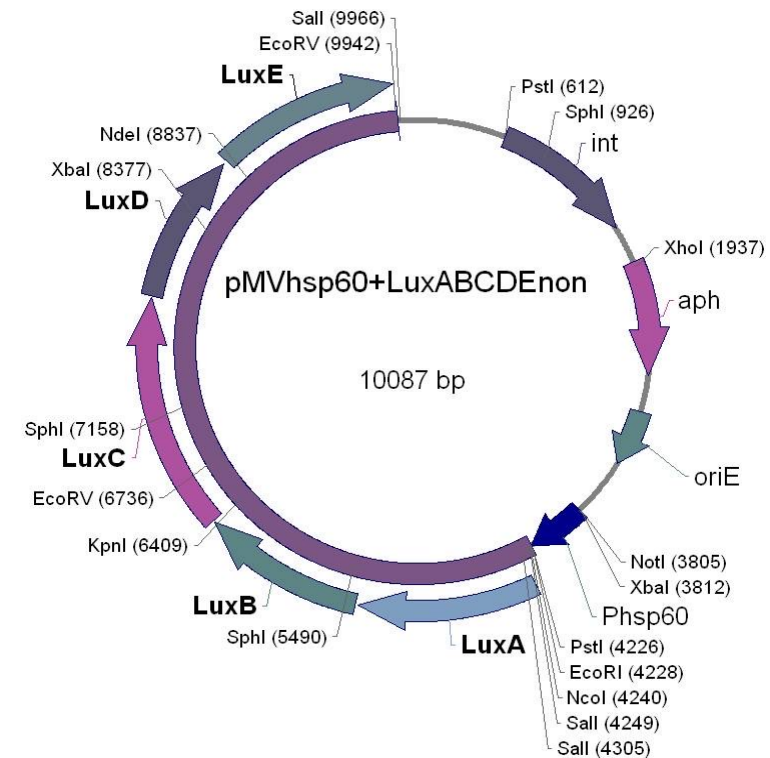

Second Generation

Integrated into chromosome

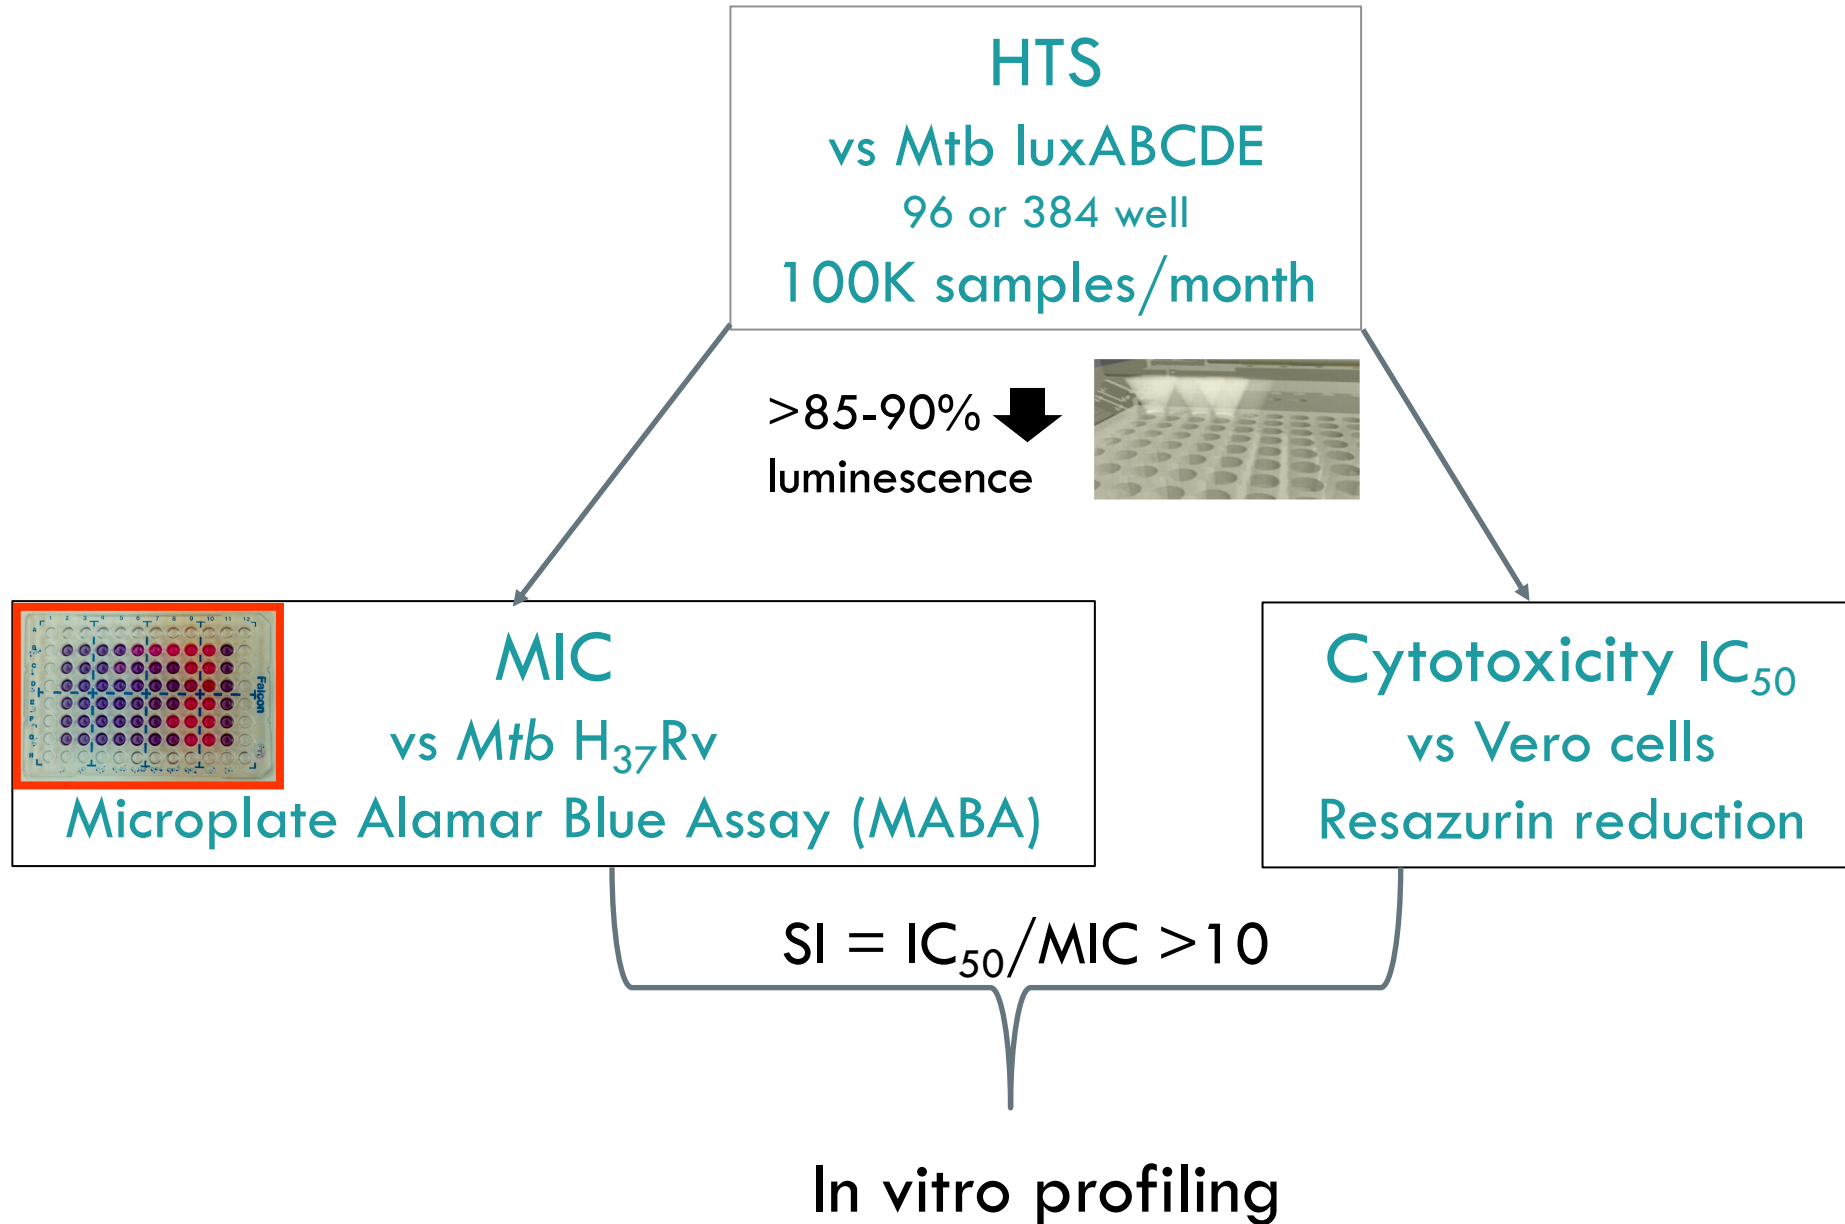

Codes for both enzyme and substrate

Enables Kinetic Assays

Andreu N, Zelmer A, Fletcher T, Elkington PT, Ward TH, et al. (2010) Optimisation of Bioluminescent Reporters for Use with Mycobacteria. PLOS ONE 5(5): e10777.

Phenotypic-based screening: hit ID

Phenotypic-based Screening: *In vitro* Hit Profiling

Property	Assay
Potential to shorten treatment	MIC vs non-replicating <i>Mtb</i> culture (LORA)
Killing effect (vs. growth inhibition only)	Minimum bactericidal concentration (MBC)
Persistent suppression of growth following compound clearance	Post Antibiotic Effect (PAE)
Ability to kill bacteria within host macrophage	Intramacrophage activity (EC90)
Synergy or antagonism in combination with established or experimental TB drugs	diaMOND to determine FICs
Frequency of mutation to resistance and target identification	Selection of resistant mutants and WGS

Non-Replicating *Mtb* luxABCDE: Low Oxygen Recovery Assay (LORA)

Low oxygen-adapted *M. tuberculosis* carrying luxABCDE

$$2 \times 10^4$$

CFU in 24-well plates

10 days under $<0.16\%$ oxygen
No replication!

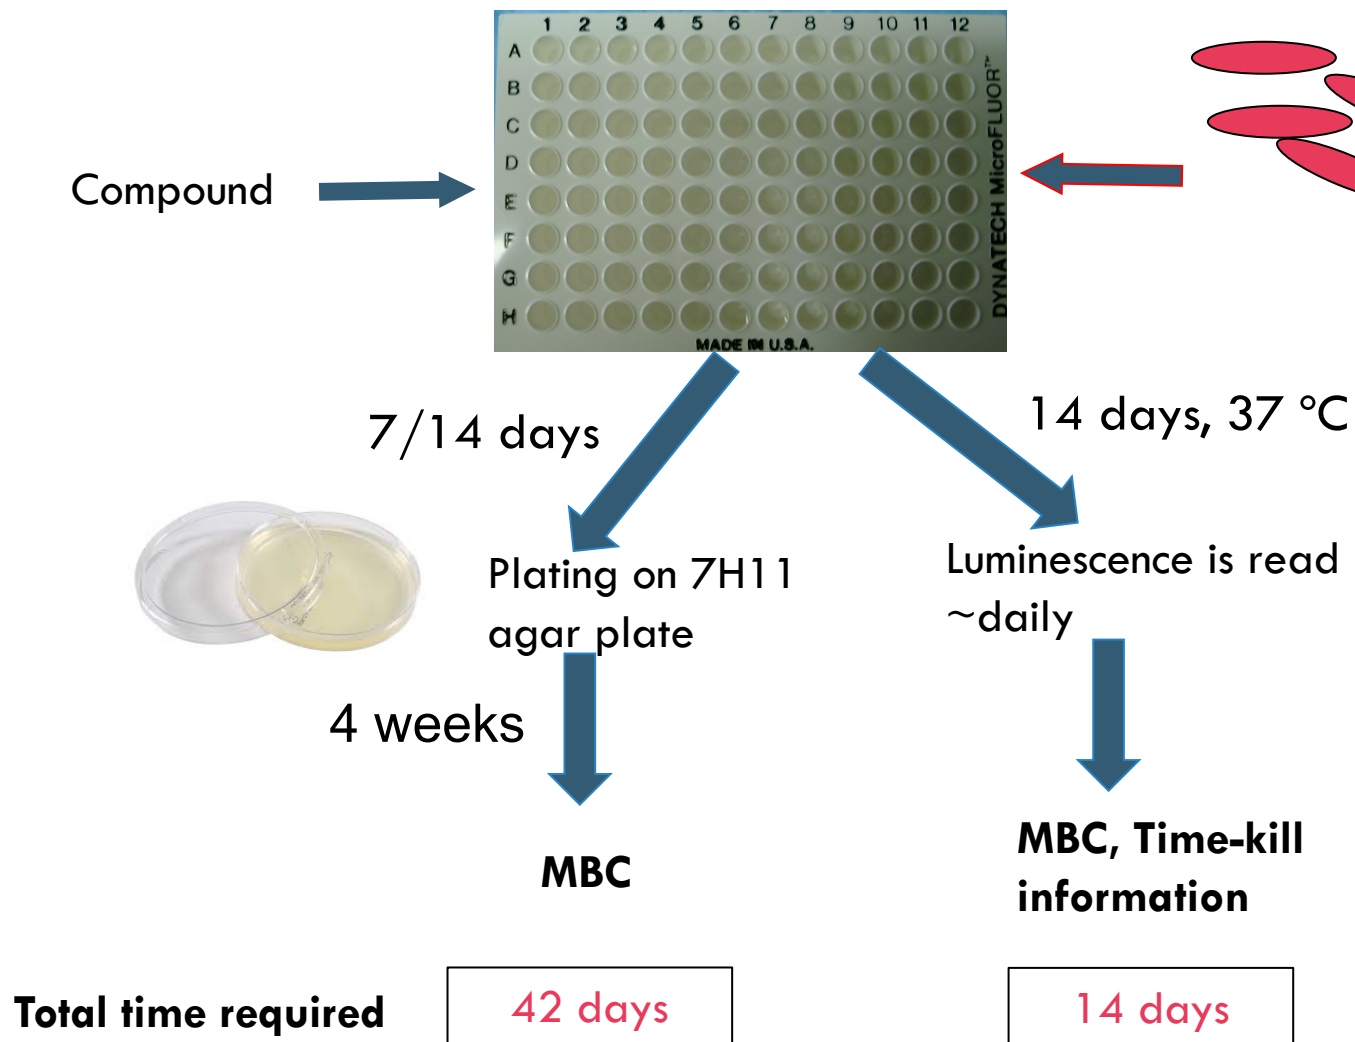

28h "recovery"
in air

luminescence

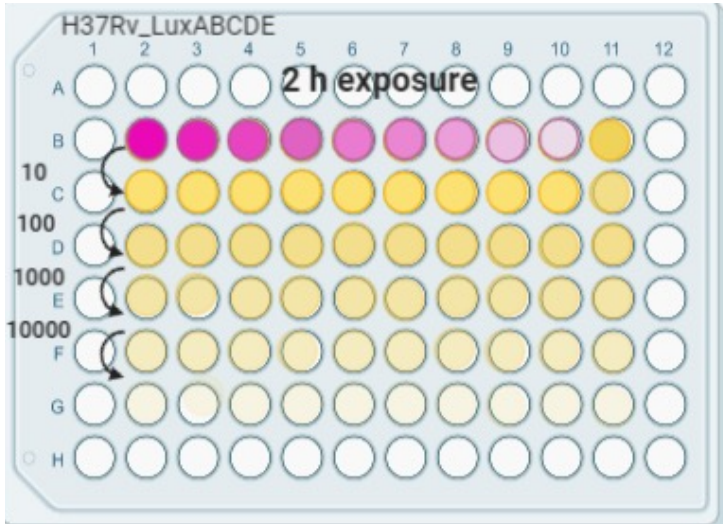

Cho S, Lee HS, Franzblau S. Microplate Alamar Blue Assay (MABA) and Low Oxygen Recovery Assay (LORA) for *Mycobacterium tuberculosis*. *Methods Mol Biol*. 2015;1285:281-92. PubMed PMID: 25779323.

MBC by CFU vs Bioluminescence Against Replicating *M. tuberculosis* luxABCDE

Post Antibiotic Effect Can Shed Light On Target Vulnerability

Activity Against Macrophage-Internalized Bioluminescent *Mtb*

5×10^4 Macrophages
seeded to 96 WP

Infect with
H37Rv_LuxABCDE
 5×10^5

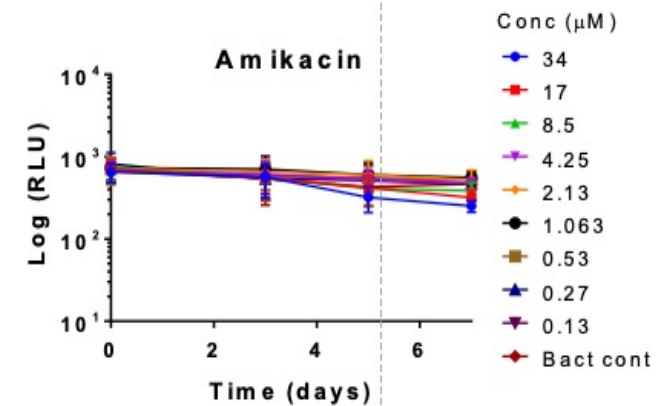

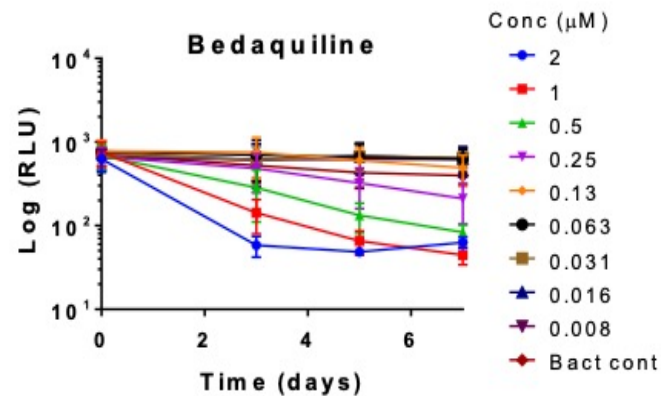

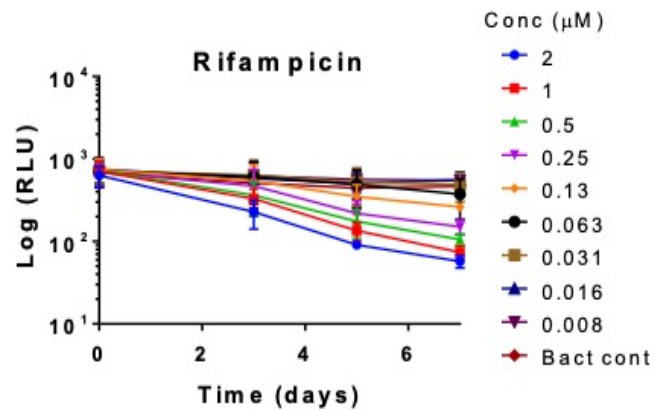

Treat with
amikacin
overnight

Wash with PBS
Add test compounds

Incubate for
6-7 days

Bioluminescence

Phenotypic based screening: spectrum of activity

Property	MIC vs
Cross-resistance to existing TB drugs	H37Rv-isogenic strains mono-resistant to INH, rifampin, ethambutol, kanamycin, bedaquiline, moxifloxacin, etc.
Effective against clinical isolates from different geographical regions	6 global clade representatives
Broad or narrow spectrum anti-mycobacterial activity	<i>M. abscessus</i> , <i>M. avium</i> , <i>M. ulcerans</i> , <i>M. bovis</i> , etc.
Broad or narrow spectrum antibacterial activity	ESKAPE panel of 4 Gram - and 2 Gram + bacteria

Efficacy in Acute and Chronic Mouse Infection Models of TB

Aerosol infection of ~100 female BALB/c mice with low dose of *M. tuberculosis* Erdman

Acute infection model

Tx begins Day 10

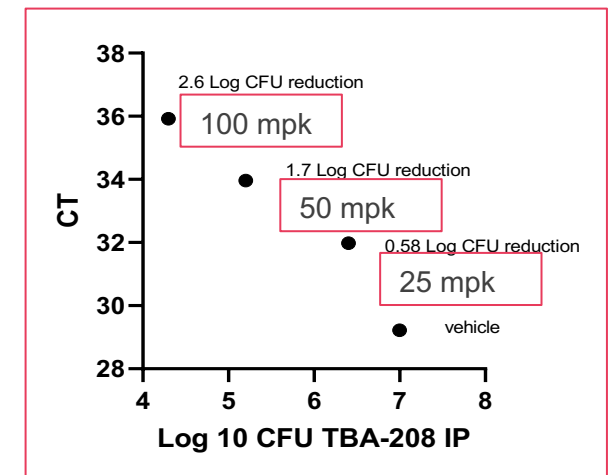

Chronic infection model

Tx begins Day 31

- 1) Mice sacrificed 3 days after final dose
- 2) Lung homogenates serially diluted & plated
- 3) Colonies counted after 3 weeks incubation

qPCR w PMA dye to reduce time to data by 3 weeks

Target profile of TB drug lead

Assay	Ideal	Acceptable
MIC	<0.1 μM	5 μM
Vero cytotoxicity IC_{50}	>100 μM	>20 μM
Vero IC_{50} /MIC	>1000	>50
LORA/MABA	<5	Any
MBC/MIC	<5	Any
EC_{90} vs intramacrophage <i>Mtb</i>	< 1 μM	<20 μM
MIC vs H_{37}Rv /drugR strains & global clades	<2x	<8x
MIC vs G+, G-/MIC vs <i>Mtb</i>	>50	>10
MIC \uparrow with serum or albumin	<4	<20
Combinations (diaMOND)	Synergistic	Not antagonistic
Mouse infection model \log_{10} lung CFU reduction	3	1
